Today’s advancements in medical procedures allow eye surgeons to correct your cataracts and astigmatism using the best technologies available. In many cases, cataract surgery may reduce the need for eyeglasses. However, it is important to understand that since everyone’s vision, expectations, and lifestyles differ, it is difficult to determine how much you will be dependent on glasses after surgery.

You’ve got a lot to do and see. That’s why your doctor may recommend that you have cataract surgery with the enVista Toric lens from Bausch + Lomb.

Bausch + Lomb is committed to high standards:

• Founded in 1853, Bausch + Lomb has over 160 years of eye health experience and has been at the forefront of some of the most significant advancements in eye health technologies
• Unique design and materials ensure vision quality that lasts for years to come
• Advanced lens technologies provide unique advantages versus other lens designs and materials currently available

INDICATIONS: enVista® toric IOL is indicated for use in patients with astigmatism after cataract removal. Astigmatism means that your eye is more egg-shaped than round. Cataract surgery is not completely risk-free. Complications may occur as a result of the removal of your cataract whether or not an intraocular lens is implanted. Complications of cataract surgery range from minor, usually temporary side effects, to sight-threatening complications. Fortunately, significant sight-threatening complications are extremely rare and include, but are not limited to: infection, hemorrhage, and retinal detachment. People with existing medical conditions such as diabetes and chronic eye infections are at a higher risk of developing complications. The risks of implantation with the enVista toric IOL include the same risks that exist for all cataract surgery with toric IOL implantation. The long-term safety and effectiveness of this lens have not been proven. The safety of the enVista toric IOL has not been substantiated in patients with preexisting conditions. This is not all you need to know. Please discuss any questions with your eye doctor.

You have cataracts and astigmatism. Your doctor has a great way to correct both at the same time.
What are Cataracts?
Cataracts are a natural part of the aging process and will eventually develop in all of us. In fact, cataract surgery is the most commonly performed procedure in the United States with over 3 million procedures annually.

As you grow older, the lens in your eye can stiffen, harden, and become cloudy. Since the lens is no longer as flexible or as clear as it used to be, the eye can’t focus light properly. This makes it difficult to see as clearly as you once did.

Common signs and symptoms of cataracts:
- Double vision
- Blurred vision
- Poor night vision
- Faded colors
- Sensitivity to light and glare
- Frequent changes to your eyeglass prescription

What is Astigmatism?
When you have astigmatism, your eye is more oval-shaped than round. As a result, light enters the eye and bends more in one direction than the other, which allows only part of an object to be in focus at one time. With astigmatism objects may look blurry or distorted.

Frequently Asked Questions:

Q. When will I be able to return to my normal activities?
A. Typically, you will be able to return to normal activities within several days. Your eyes may be sensitive to touch for a few days, and you should avoid rubbing them. It is important to avoid any lifting or straining that could increase pressure on your eyes.

Q. Will I be able to see without glasses?
A. Since everyone’s vision, expectations, and lifestyles differ, it is difficult to determine how much you will be dependent on glasses after your surgery. As with all monofocal IOLs, most patients will need to continue to wear reading glasses for near vision activity.

Q. How often will I need to have my eyes checked after surgery?
A. Your doctor will advise you based on your procedure. Make sure you follow the appropriate recommendations from your doctor for the best outcomes.

Q. How long does cataract surgery take?
A. Preparing your eye for surgery usually takes an hour or so. You may receive different types of eye drops, along with some medication to help you relax. Typically, the full cataract surgery procedure takes 15 to 20 minutes, followed by a brief stay (often an hour or less) in outpatient surgery.

Q. Will I feel anything?
A. During the surgery, your doctor will use a special device to stabilize your eye and keep your eyelids open. You may experience some slight pressure during the procedure, but you should not feel any pain.

Questions to Ask Your Doctor:
Knowing what to ask your doctor can be important. In addition to getting answers to the questions you already have, consider getting answers to the questions listed below.

- What are the risks and benefits associated with each of these treatment options?
- Which cataract treatment do you recommend?
- Am I a good candidate for the enVista® Toric IOL?
- What does this procedure involve?
- What are the benefits, risks, and possible complications of having cataract surgery?
- How should I prepare for the procedure?
- What will my vision be like after recovery?

enVista® Toric IOL
The enVista Toric Intraocular Lens (IOL) is designed to treat your cataracts and astigmatism at the same time. And provide you with the best possible quality of vision. Made of an advanced, next-generation material, enVista Toric IOL is also designed to provide long-term clarity. See the difference enVista Toric can offer:

- Astigmatism correction
  - Advanced astigmatism correction at the same time as cataract surgery
- Sharp focus
  - For clearly defined images
- Clear vision
  - Advanced material stays clear inside the eye
